

Lap Band Adjustment

Lap Band Adjustment

One of the many advantages to the Lap Band Surgery Process is that the lap band is adjustable by completing a short office visit with one's doctor. Having the band adjusted at a later time in the doctor's office allows the individual to deflate or inflate the band as necessary for them to be able to control the amount of food that they take in.

When a patient needs to have the Lap Band adjusted, it can be done through a simple procedure having a saline solution inserted into the Lap Band itself. The surgeon does this by easily placing a saline-filled needle into the skin and then into the reservoir portion of the Lap Band. This adjustment can also be provided for women who are looking to become pregnant or individuals who seek to lose additional weight.

Each individual who has Lap Band Surgery Process needs to remember that there is no guarantee of weight loss and they must follow dietary recommendations and follow up visits as instructed. Being active and exercising on a regular basis will also assist the person in their weight loss goals.
